LAB 01:
Using vagrant box command, download and install the hashicorp/precise64 box. Create a new Vagrant VM out of that box.

LAB 02
On you host machine, create a new directory: logs in the project directory. Change the Vagrantfile to disable the default share and share and /var/log on the logs directory. Make sure that you can view the system logs from the host machine.

LAB 03
Install Apache2 webserver, use the Vagranfile to map port 8000 on the host to port 80 on the guest. Ensure that you can view Apache2 default welcome page from the host machine by visiting http://localhost:8000.

LAB 03
Without stopping the webserver on the guest machine, use vagrant suspend to pause the VM. Then use vagrant resume to bring the machine back. Ensure that you can still access the web page through your host browser.
